

The point of no return

Name	Class	Date
------	-------	------

Watch only Everybody stays behind the line, seated, for the whole demonstration. Melted sugar is hotter than boiling water and it sticks to skin. Nobody comes forward for any reason.

Part 1 • The sugar escalation

One substance. More and more heat. Record what you SEE, HEAR and SMELL at each stage.

Stage	What is happening	What I observed	Still sugar?
1	Cold sugar		Y / N
2	Edges go clear		Y / N
3	All liquid		Y / N
4	First colour		Y / N
5	Amber		Y / N
6	Dark		Y / N

Mark the stage where you believe SUGAR STOPPED EXISTING: Stage _____

The evidence that convinced me (more than one thing):

Part 2 • The two samples

A spoonful came out at stage 3 and another at stage 5. Both have now cooled.

The STAGE 3 sample, once cool	
The STAGE 5 sample, once cool	
Which one is still sugar?	

The sugar went liquid at stage 3 AND at stage 5. Why is only one of those reversible?

Change	Temperature	Did it come back?
Chocolate melted		
Egg white set		
Water boils	100 °C	Yes — steam condenses back to water

4. Does knowing the temperature tell you whether a change is reversible? Explain.

Push me Argue that the sugar transition happened one stage EARLIER or LATER than the class agreed — and defend it with evidence. What would have settled the argument?
