

Recommendation to the client

Name	Group	Class	Date
------	-------	-------	------

Who you are writing to [CLIENT NAME] has a real problem with rusting metal at this school. They will read this and write back. Your recommendation could be wrong — that is why you have to say how sure you are. They are not a scientist and they are not marking you. They need to know what to do, and how much to trust it.

1

What we tested

Your question and what you changed. Two sentences is plenty.

2

What we found

Your results. Put the numbers in the table below and draw the graph.

Our results

Treatment	Jar 1	Jar 2	Jar 3	Average

Our graph

Write your scale				

Label the bottom axis with your treatments.

3

What it means
The pattern, in words. Do not just list the numbers again.

4

What we recommend
One clear thing the client could do on Monday.

5

How confident we are

What could have gone wrong — in our method AND in the other class's.

Two ways to lose marks here Hedging so hard the client cannot act: “it might work but we're not sure about anything”. Or overselling: “this definitely stops rust forever”. What you want is — here is what we found, here is what would make it more certain, here is how much weight to put on it for now.

6

What we would do next

One question your data cannot answer.

Using the other class's work

What we took from their data	
Where we did not trust it, and why	

Using someone else's results without saying where they came from is not honest. Using them without saying what you thought of them is not careful. Do both.
