

Challenge question cards

Cut into twelve. Shuffle. Each group draws two after presenting — unseen, so nothing can be rehearsed. Everyone in the group answers at least one.

How do you know that? <i>The answer should contain a number or an observation, not a feeling.</i>	The other class got a different result. Why? <i>Looking for a method difference, not “they did it wrong”.</i>
What would change your mind? <i>A strong answer names a specific result that would overturn theirs.</i>	What is the weakest part of your method? <i>Naming it yourself scores; having it pointed out does not.</i>
Why should the client believe you rather than a website? <i>Because they collected the evidence themselves, under known conditions.</i>	If you only had one of your three jars, would you still say the same thing? <i>Tests whether they understand why replicates matter.</i>
Your three jars disagreed. Which one was right? <i>None of them — or all of them. The spread IS the information.</i>	What did you take from the other class, and did you trust it? <i>Both halves required.</i>
Would your recommendation still work outdoors in the rain? <i>Their test was indoors. Honest answer: we do not know, and here is why.</i>	What would happen if the coating got scratched? <i>The gap result, if they have it. Otherwise a reasoned prediction.</i>
How long do you think your protection would last? <i>No data beyond a week. A good answer says so.</i>	If we gave you another week, what is the first thing you would do? <i>Should follow from the weakness they already named.</i>

The small italic line is for you, not them Trim it off before cutting if you would rather the cards were clean. It is there so you know what a good answer sounds like when you are listening to six groups in thirty minutes.
